                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       281
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          293
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             54
                                                                                                                                                                                                                                                                                                                                                                                                       New nucleic acid molecule encoding replication protein/plasmid stability
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention describes a novel nucleic acid encoding a replication protein or a plasmid stability protein. The product of the invention is useful for expression of nucleic acid such as genes encoding enzymes involved in the production of isoprenoid molecules, polyhydroxyalkanoic hydratases, ethyllene forming enzyme, pyruvate decarboxylase, alcohol dehydrogenase, terpene synthases, and cholesterol oxidase in an Actinomycetales bacteria. The replication protein or plasmid stability protein are useful in Choning and expression vectors and particularly in shuttle vectors for the expression of homologous and heterologous genes in Rhodococcus sp. This sequence represents a Rhodococcus AN12 Rep
                  forming enzyme;
                                                                                                                                                                                                                                                                                                                                                                                                                         protein, useful in cloning and expression vectors, particularly shuttle vectors for expression of heterologous genes in Rhodococcus species.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        115 GHRAADREGIRDKIGYVGMIRATEVTVGQINGWHPHIHAIVLVGGRTEGERSAKQIVATF

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               288
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              320
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to a new bacterium of genus Ketogulonigenium. Ketogulonigenium may further comprise a transgene, comprising a DNA sequence from an endogenous Ketogulonigenium plasmid. Methods for transforming Ketogulonigenium are also described. The invention is useful for producing 2-keto-L-gulonic acid (2-KLG) from L-sorbose or sorbitol. The present sequence represents the replication protein encoded by the Ketogulonigenium endogenous plasmid pADNX6L2. (Updated on 07-AUG-2003 to correct OS field) (Updated on 29-AUG-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         109 DGGRRAFFSGLAQCRNVWGCAVCSARIAQIRRSEMNHLLAWARDNGFVPVLITLTAQHKA

                                                                                                                                            à
                                                                                                                                                                                                            ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention describes a novel nucleic acid encoding a replication brotein or a plasmid stability protein. The product of the invention is useful for expression of nucleic acid such as genes encoding enzymes involved in the production of isoprenoid molecules, polyhydroxyalkanoic acid (PHA) synthases, carotenoid biosynthesis enzymes, nitrile acid (PHA) synthases, carotenoid biosynthesis enzymes, nitrile dehydrogenase, terpene synthases, and cholesterol oxidase in an Actinomycetales bacteria. The replication protein or plasmid stability protein are useful in cloning and expression vectors and particularly in shuttle vectors for the expression of homologous and heterologous genes in Rhodococcus sp. This sequence represents a S. phaecchromogenes pUVI replication protein described in the disclosure of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ------GCDGYVRAVEITEREMY-------GCDGYVRAVEIT 161

The inventors claim an inoculum for silage which comprises lactic acid bacteria, esp. Lactobacillus plantarum and E. faecalis, transformed with an exogenous by an enzyme which breaks down an oligosacc-haride and/or a polysaccharide into a fermentable carbohydrate. The exogenous enzyme is especially an alpha-amylase encoded by the DNA sequence in AAM91246, particularly from nucleotides 184 to 2131 (Claims c. sequence in AAM91246, particularly from nucleotides 184 to 2131 (Claims 2, 6 and 10). The transformed lactic acid bacteria can break down polysaccharides in a silage crop to provide a complete source of the fermentable carbohydrates that the lactic acid bacteria conce of the fermentable carbohydrates that the lactic acid bacteria by the transformed lactic acid bacteries which can be used for establishing and maintaining optimal intestinal flora in animals, including chumans. A plasmid contg. the DNA sequence in AAM91248 is claimed. The plasmid is pLH1 or plablo00. (Updated on 03-0CT-2002 to add missing OS field.) (Updated on 25-MAR-2003 to correct PA field.)

Sequence 304545, Application US/09252991A

Patent No. 6551795

GENERAL INFORMATION:

APPLICANT: Marc J. Rubenfield et al.

TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS

TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

CURRENT APPLICATION NUMBER: US/09/252,991A

CURRENT FILING DATE: 1999-02-18

PRIOR APPLICATION NUMBER: US 60/074,788

PRIOR PILING DATE: 1998-07-27

NUMBER OF SEQ ID NOS: 33142

SEQ ID NOS: 33142

Sequence 17653, Application US/09252991A

Patent No. 6551795

GENERAL INFORMATION:
APPLICANT: Marc J. Rubenfield et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
TITLE OF INVENTION: AERCIGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: 107196.136
CURRENT APPLICATION NUMBER: US/09/252,991A

CURRENT PILING DATE: 1999-02-18

PRIOR APPLICATION NUMBER: US 60/074,788

PRIOR APPLICATION NUMBER: US 60/094,190

PRIOR FILING DATE: 1998-02-18

PRIOR FILING DATE: 1998-07-27

NUMBER OF SEQ ID NOS: 33142

                                                                                                                                                                    ò
                                                                                                                                                                                        ద
                                                                                                        ð
                                                                                                             This invention describes a novel nucleic acid encoding a replication protein or a plasmid stability protein. The product of the invention is useful for expression of nucleic acid such as genes encoding enzymes involved in the production of isopremoid molecules, polyhydroxyalkanoic hydratases, ethylene forming enzyme, pruvate decarboxylase, alcohol dehydrogenase, terpene synthases, and cholesterol oxidase in an Actinomycetales bacteria. The replication protein or plasmid stability protein are useful in cloning and expression vectors and particularly in shuttle vectors for the expression of homologous and heterologous genes in Rhodococcus sp. This sequence encodes the Rhodococcus AN12 Rep protein

                                   protein/plasmid stability
                                 New nucleic acid molecule encoding replication protein/plasmid stability protein, useful in cloning and expression vectors, particularly shuttle vectors for expression of heterologous genes in Rhodococcus species.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ThrHisGlyLysAsnGlyTrpHisValHisValHisAlaLeuLeuWetPheSerGlyAsp
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ArgTrpArgThrGluArgGluMetTyrGlyCysAspGlyTyrValArgAlaValGluIle
